

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (original) An etching apparatus comprising:

(a) a rotating means for holding a semiconductor wafer and 5 for rotating said wafer in a horizontal plane;

said wafer having a device area and a surface peripheral area on its surface;

said surface peripheral area being located outside said device area; and

(b) an edge nozzle for emitting an etching liquid toward a surface peripheral area of said wafer;

wherein said etching liquid emitted from said edge nozzle selectively etches out an unnecessary material existing in said surface peripheral area of said wafer.

2. (original) The apparatus according to claim 1, wherein said etching liquid emitted from said edge nozzle has an emission direction oriented along a rotation direction of said wafer or outward with respect to a tangent of said wafer formed near a contact point of said liquid with said surface peripheral area of said wafer.

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

3. (original) The apparatus according to claim 1, further comprising a back nozzle for emitting an etching liquid toward a back center of said wafer;

wherein said etching liquid emitted from said back nozzle etches out an unnecessary material existing on a back of said wafer.

4. (original) The apparatus according to claim 1, further comprising a 5 surface nozzle for emitting a protecting liquid toward a surface center of said wafer;

wherein said protecting liquid emitted from said surface nozzle covers said device area of said wafer to protect the same against said etching liquid emitted from said edge nozzle.

5. (original) The apparatus according to claim 1, further comprising a back nozzle for emitting an etching liquid toward a back center of said wafer and a surface nozzle for emitting protecting liquid toward a surface center of said wafer;

wherein said etching liquid emitted from said back nozzle etches out an unnecessary material existing on a back of said wafer, and said protecting liquid emitted from said surface nozzle covers said device area of said wafer to protect the same against said etching liquid emitted from said edge nozzle.

6. (original) The apparatus according to claim 1, wherein said etching liquid emitted from said edge nozzle is beam-shaped.

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

7. (original) The apparatus according to claim 1, wherein said rotating means is of a roller-chucking type, in which said means comprises rollers arranged along an end face of said wafer, and said rollers are contacted with said end face of said wafer to hold said wafer and rotated synchronously.

8. (original) The apparatus according to claim 1, wherein said rotating means is of a pin-chucking type, in which said means comprises pins supported by a supporting member and arranged along an end face of said wafer, and said pins are contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member.

9. (original) The apparatus according to claim 1, wherein said rotating means is of a pin-chucking type, in which said means comprises a first plurality of pins and a second plurality of pins supported by a supporting member; wherein said first plurality of pins and said second plurality of pins are alternately arranged along an end face of said wafer; wherein said first plurality of pins and said second plurality of pins are alternately contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member.

10. (original) The apparatus according to claim 1, wherein said rotating means comprises a first plurality of pins and a second plurality of pins supported by a supporting member; wherein said first plurality of pins are arranged along

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

an end face of said wafer and said second plurality of pins are arranged along said end face of said wafer;

and wherein said first plurality of pins are contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member in a period, and said second plurality of pins are contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member in another period.

11. (original) The apparatus according to claim 1, wherein the distance of an end of said edge nozzle from a point where a longitudinal axis of said edge nozzle intersects said surface of said wafer is set as a value in the range of 1 mm to 50 mm, and the angle of said edge nozzle with respect to a tangent of said wafer at said point is set as a value in the range of 0° to 90°.

12. (original) The apparatus according to claim 3, wherein the distance of an end of said back nozzle from said back center of said wafer is set as a value in the range of 70 mm to 200 mm, and the angle of said back nozzle with respect to said back of said wafer is set as a value in the range of 15° to 60°.

13. (original) The apparatus according to claim 4, wherein the distance of an end of said surface nozzle from said surface center of said

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

wafer is set as a value in the range of 70 mm to 200 mm, and the angle of said surface nozzle with respect to said surface of said wafer is set as a value in the range of 15° to 60°.

14. (original) A cleaning apparatus comprising:

(a) a rotating means for holding a semiconductor wafer and
for rotating said wafer in a horizontal plane;

said wafer having a device area and a surface peripheral
area on its surface;

said surface peripheral area being located outside said 15 device area; and

(b) an edge nozzle for emitting a cleaning liquid toward a surface peripheral area of
said wafer;

wherein said cleaning liquid emitted from said edge nozzle selectively removes an
unnecessary material existing in said 20 surface peripheral area of said wafer.

15. (original) The apparatus according to claim 14, wherein said cleaning liquid emitted
from said edge nozzle has an emission direction oriented along a rotation direction of said wafer
or outward with

respect to a tangent of said wafer formed near a contact point of said liquid with said
surface peripheral area of said wafer.

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

16. (original) The apparatus according to claim 14, further comprising a 5 back nozzle for emitting a cleaning liquid toward a back center of said wafer;

wherein said cleaning liquid emitted from said back nozzle removes an unnecessary material existing on a back of said wafer.

17. (original) The apparatus according to claim 14, further comprising a surface nozzle for emitting a protecting liquid toward a surface center of said wafer;

wherein said protecting liquid emitted from said surface nozzle covers said device area of said wafer to protect the same 15 against said cleaning liquid emitted from said edge nozzle.

18. (original) The apparatus according to claim 14, further comprising a back nozzle for emitting a cleaning liquid toward a back center of said wafer and a surface nozzle for emitting protecting liquid

toward a surface center of said wafer;

wherein said cleaning liquid emitted from said back nozzle etches out an unnecessary material existing on a back of said wafer, and said protecting liquid emitted from said surface nozzle covers said device area of said wafer to protect the same against said

cleaning liquid emitted from said edge nozzle.

19. (original) The apparatus according to claim 14, wherein said cleaning liquid emitted from said edge nozzle is beam-shaped.

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

20. (original) The apparatus according to claim 14, wherein said rotating means is of a roller-chucking type, in which said means comprises rollers arranged along an end face of said wafer, and said rollers are contacted with said end face of said wafer to hold said wafer and rotated synchronously.

21. (original) The apparatus according to claim 14, wherein said rotating means is of a pin-chucking type, in which said means comprises pins supported by a supporting member and arranged along an end face of said wafer, and said pins are contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member.

22. (original) The apparatus according to claim 14, wherein said rotating means is of a pin-chucking type, in which said means comprises a first plurality of pins and a second plurality of pins supported by a supporting member; wherein said first plurality of pins and said second plurality of pins are alternately arranged along an end face of said wafer; wherein said first plurality of pins and said second plurality of pins are alternately contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member.

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

23. (original) The apparatus according to claim 14, wherein said rotating means comprises a first plurality of pins and a second plurality of pins supported by a supporting member;

wherein said first plurality of pins are arranged along an end face of said wafer and said second plurality of pins are arranged along said end face of said wafer;

and wherein said first plurality of pins are contacted with said end face of said wafer to hold said wafer and rotated

synchronously by said member in a period, and said second plurality of pins are contacted with said end face of said wafer to hold said wafer and rotated synchronously by said member in another period.

24. (original) The apparatus according to claim 14, wherein the distance of an end of said edge nozzle from a point where a longitudinal axis of said edge nozzle intersects said surface of said wafer is set as a value in the range of 1 mm to 50 mm, and the angle of said edge nozzle with respect to a tangent of said wafer at

said point is set as a value in the range of 0° to 90°.

25. (original) The apparatus according to claim 16, wherein the distance of an end of said back nozzle from said back center of said wafer

PRELIMINARY AMENDMENT
Divisional of Application No. 09/525,445

is set as a value in the range of 70 mm to 200 mm, and the angle of said back nozzle with respect to said back of said wafer is set as a value in the range of 15° to 60°.

26. (original) The apparatus according to claim 17, wherein the distance of an end of said surface nozzle from said surface center of said wafer is set as a value in the range of 70 mm to 200 mm, and the angle of said surface nozzle with respect to said surface of said wafer is set as a value in the range of 15° to 60°.

Claims 27-47. (canceled)
